Note - The Debit and Credit Cards data is not store as it needs to be processed on the Payment gateway level. We have not shared any of the data stored with them in the form of postcards. Hi, Thanks for the tutorial. I have some questions. 1) Will the quality of the postcard presentation be the same as the E-postcard? 2) The result of the process for the recipient, to use the postcard? 3) Will the card template have a security key or other in the future? 4) What are the differences between each type of card? What are the differences between the 4 types of cards? Can you send all of them to one recipient? 5) How are these postcards made? And where are they produced? Answered by Apostolis Kostopoulos January 16, 2019 Great questions! 1) The quality of the postcard presentation will be exactly the same as the electronic postcard. 2) We provide the result of the process for the recipient. 3) Yes, in the future we will provide a security key. 4) Please be advised that the postcards are made at Rheal, however the production process is not clearly described at this moment. There are only 4 different types of postcards that can be sent to the recipients, however they can send all 4 types at once to a recipient. 5) We are still in development and are trying to find the best and most secure solutions to reach the highest levels of security and transparency. Yes, you can send all 4 types of postcards to one recipient. However, the Electronic postcard will have a special code to receive. Nikiel February 14, 2019 Great tutorial! I have just one question: Is it possible to send these 4 types of postcards to one recipient using email? February 16, 2019 Great question, Nikiel! Thanks! Yes, it is. However, the recipient should be able to decide if he or she wants to receive the postcard by email. Thank you for your interest. Apostolis Kostopoulos 82157476af
